Ownership Count

Due according to the class schedule.

Assignment

In this assignment you will explore which users and groups files in the operating system belong to.

Requirements

On the machine [php.cs.dixie.edu], you will count how many files belong to each user/group combination. You will do this for each user/group combination that exists, in each of the directory trees /etc, /usr, and /var.

Details

- In some of these systems, you will not be able to access all of the files. Report on those you can access.
- For our purposes, directories are files, include them in the count.
- Be sure not to include files that are not local to the hard drive.
- Create a table for each of the directory trees that shows the user/group combination and the number of files found.

   • Hint:

   ```console
   ls -lR, awk, sort, and uniq
   ```

   • Hint: Do them in that order. You could create a table of output for /var with a single line... then do it for /etc/ and the other directory.

   • Hint2: Look at the ‘-c’ flag for the ‘uniq’ command.

   • Hint, here are some counts I found in /var (Spring 2017)

   ```
   2 _apt root
   69 man root
   46 root adm
   1 root crontab
   1 root Debian-exim
   1 root lxd
   1 root mail
   1 root mlocate
   10399 root root
   2 root shadow
   1 root staff
   1 root syslog
   5 root utmp
   ```

   • if you are off by a few, that is ok. Different ways of doing it might result in different counts.

Submission and Passoff

• Submit a PDF with your 3 tables to the instructor.
