IT 3110: Systems Automation

Shell Scripting 4

Assignment

This assignment will hone your skills as a Bash shell programmer.

Tasks

Create the following script:

A script which automates the creation of an NFS share (mkdir), puts the correct entries in /etc/exports, and then mounts that share on all clients.

You may optionally choose to automatedly add a line to /etc/fstab for these mounts.

A sample run of your script might look like this:

```
./script.sh <sharename> <mountpoint>
./script.sh /shares/fruit /nfs/fruit
```

Thus, your script would automatically create the /shares/fruit directory on your nfs server (if it didn’t already exist). Or create whatever sharename was passed into the script. Then it will need to add a line to /etc/exports. Then it may need to run exportfs -a to make that new nfs share visible to clients. Then your script would ssh to all your machines and create the new mountpoint like /nfs/fruit, and mount your share.

Report

Take a print screen of your scripts running. Also upload your scripts.

Submission

- Submit your report and images to the (SCRIPT 4) assignment in the Canvas
