This assignment will hone your system automation skills with salt.

Tasks

NFS

You are going to recreate the assignment that you have done earlier, but with saltstack.

By the end of this project, you should have the appropriate files that will:

- create a '/salt_share/vegetables' directory on your nfs server
- Make sure that the correct entries appear in `/etc/exports`
- Restart the nfs service
- Connect to each of your nfs clients (minimum 2) and mount the export to `/salt_nfs/vegetables`. You will probably also have salt create that directory.

Submission

Pass off in class.
