Put your XenServer instances into a pool. Connect your NFS or iSCSI datastore to your pool. Create a new Windows 7 virtual machine that utilizes the datastore.

On your windows vm, you should install XenServer Manager. Use it to connect to your pool and do the following:

You need to create the following virtual machines (they should all utilize the datastore):

- Ubuntu 16.04
- Windows 10
- Something else of your choice.

You should connect to the NFS ISO store found at `144.38.192.167:/vol/student_vm/qemu/iso`.

**To pass off**

You will show me your vm’s in class. Demonstrate you can migrate a machine to any node in your pool.
