Complete the tutorial found here. Start by installing the required packages, node, npm, then run npm install. Then enable the microk8s dns service (microk8s.enable dns). I suggest starting at the ‘Introduction to Kubernetes’ section, though there is a great docker review as well. (Ignore anything that relates to Minikube, you should already have kubectl installed and running in Microk8s). At the very end, it asks you to update the IP address inside of App.js. The IP address that you should use, should be your public IP address. The port number will be the port number given to you by the output of kubectl get svc.

To Pass off

Prove to me that you have a kubernetes cluster running and can view sentiment analysis.
