**Final Project**

**Objective**

- You will research and be able to explain different job requirements of a web administrator
- Find a required skill that you are not familiar with, research it, implement it, present it.
- Demonstrate good public-speaking skills

**Description**

Using a job search engine of your choice do a search for web administrator. Try to only examine those jobs that aren’t ‘design’ oriented, strictly administrative oriented. Review the technical job skills that these employers are looking for. Find one skill that you are not familiar with.

When you have found a skill that you are not familiar with, research it and implement it. (If it is not a skill that you can familiarize yourself with, choose another one.)

One example that I found had this as a required qualification:

Knowledge of open source CMS platforms and development.

So, if I were choosing that one. I would research the different CMS platforms that were available, choose one, install it and try to figure it out. (Obviously you probably won’t be professionals with it by the time you are done)

**To pass off**

During the time indicated in class you will present your findings. This presentation should be professional in dress, vocabulary, visual aids, etc... You will be graded accordingly.

You should present the job that you found, the skill that it required, the things that you did to research that skill, why it might be important for web administrators to know. If you implemented something, it would be VERY appropriate for you to give us a short demonstration of that technology. How ‘in-demand’ is that particular skill? Is it only required for that particular job, or are there others that also would require it? Can you find any particular salary information for those that have this particular skill?

These presentations should be no more than 10-15 minutes in length.
