Nagios Project
Continuous Monitoring exploration

Nagios

Install nagios as indicated on [this](#) website. (Alternatively, you could use a nagios docker container if you would like) Configure at least 2 additional nodes besides the localhost to monitor. You should monitor ssh and http on each of the nodes. [Here](#) are some service examples that you might use.

**To pass off**

Demonstrate that you have a nagios instance that can monitor various services on multiple hosts.
