**Jenkins - Production**

**Objectives:**

- Deploy your build to a production server using tomcat

**Requirements:**

Before you continue on where you left on the last assignment, you must first install Apache Tomcat. Here are some general commands that I used. I installed mine on a separate vm from any jenkins stuff. Make sure tomcat is running on that host:8080.

Look at your pom.xml in the repo. You might have to change some things.

Before seeing if jenkins can do it, you can do a test from the project directory:

- `mvn tomcat7:deploy`

**Check off procedure:**

Show me the money!
