Jenkins - Production

Objectives:

- Deploy your build to a production server using tomcat

Requirements:

Before you continue on where you left off on the last assignment, you must first install Apache Tomcat. Here are some general commands that I used. I installed mine on a separate VM from any Jenkins stuff. Make sure tomcat is running on that host:8080.

Look at your pom.xml in the repo. You might have to change some things.

Before seeing if Jenkins can do it, you can do a test from the project directory:

- `mvn tomcat7:deploy`

Check off procedure:

Show me the money!
