**Vagrant AWS**

**Objectives:**
- Automated provisioning of vms

**Requirements:**
Use vagrant to do the same thing as the last project, but on AWS.
Some screenshots to help are [here](#).

**A few notes**
- If you reprovision the vm, you will have a new ip
- You will need to manually open the firewall (default security group) to allow http connections on port 80.
- Make sure you install the vagrant aws plugin (this may have to be re-installed if you logout the pc and back in)

**Check off procedure:**
Demonstrate that this works.
