Production VM

Objectives:

- Configure an environment that can build Java executables
- Configure a production-ready environment

Description:

In this assignment you will:

- install several packages
- use git
- run the sample application

Requirements:

- Begin by installing \texttt{git} on a new Ubuntu machine
- Create your own github account
- Install \texttt{default-jdk}, \texttt{default-jre}, \texttt{git}
- Fork the repo \url{https://github.com/nachofree/spring-petclinic.git} to your own github account.
- Clone your new git repo to the local machine
- \texttt{cd} into the new directory and run \texttt{./mvnw spring-boot:run}
- Verify that you can access the spring-petclinic application that should run on port 8080 on that machine (if you are testing from off-campus, this might be blocked at the firewall)

Check off procedure:

This will be passed off in class. You should have your browser open to your application.
