Scapy 2

TCP Handshake

Write and execute the code that will perform a three-way TCP handshake to [packtpub.samsclass.info](http://packtpub.samsclass.info) with a destination port of 40001. Here is some code to get you started (it generates the 3 way handshake):

```python
#!/usr/bin/python
from scapy.all import *

conf.L3socket
conf.L3socket=L3RawSocket

i=IP()
i.dst = "cit.dixie.edu"

t = TCP()
t.dport = 80
r = sr1(i/t)
t.flags = "A"
t.seq = r.ack
t.ack = r.seq + 1
p = i/t
send(p)
```

You will probably have to disable RST packets by doing something like:

```bash
sudo bash
iptables -F;
iptables -A OUTPUT -p tcp --tcp-flags RST RST -j DROP
```

Send an 8 character code as raw data. (Probably not your last name). You should be able to see if you succeeded by visiting [this](http://this) site. No more than 8 characters.

Land Attack

Read what this type of attack is [here](http://here). This attack could still be relevant due to IoT. Simulate the attack by sending a single packet to your windows machine. You should send it to port 445. If your windows machine isn’t listening on 445, you could create a folder on the desktop and share it. Verify port 445 is open with nmap. Capture 1 packet with tcpdump as indicated on [this](http://this) page. You will run your scapy code in one terminal, then run tcpdump in another terminal on the same machine. Take a screenshot that you have entered the winners page. The correct link to the winners page is [here](http://here)

To Submit

- Tell me what code you submitted to the website. Also upload your code.
